

**ABSTRACT OF THE DISCLOSURE**

A digital camera provided with an image pickup device; a readout controller for the electrical signals accumulated; a section to acquire image information according to the electrical signals readout; a controller for displaying images based on the image information; and a processor to output electrical signals accumulated in a first output area within an image capturing area at a first speed and to output electrical signals accumulated in the second output area at a second speed higher than the first speed; wherein the information of a predetermined area within the first output area is acquired during the signal output processing, and a moving image based on the image information of the predetermined area is displayed in a display area corresponding to the predetermined area during the signal output processing, and a still image is displayed in the other display area.
